IN THE UNITED STATES DEPARTMENT OF AGRICULTURE
IN THE MATTER OF:

STAKEHOLDERS MEETINGS)
NATIONAL FOOD PROCESSORS)
ASSOCIATION MEETING)

Room 1A-001
Federal Drug Administration
5100 Paint Branch Parkway
College Park, Maryland

Wednesday,
February 25, 2004

The parties met, pursuant to the notice, at
1:37 p.m.

BEFORE: MS. CINDY SMITH

APPEARANCES:

For United States Department of Agriculture,
Animal Plant Health Inspection Service,
Biotechnology Regulatory Services:

REBECCA BECH, Associate Deputy Administrator
SUSAN KOEHLER
JOHN TURNER
NEIL HOFFMAN

For National Food Processors Association:

JEFFREY T. BARACH, Ph.D., Vice President

(1:37 p.m.)

We want to thank you for taking time from your busy schedule to join us for this meeting and share your thoughts with us today.

We have here from BRS most of our management team, as well as several staff members, and where available, other key agency personnel that support BRS will be joining us in these meetings, as well.

I should also mention two key individuals who have been dedicated to providing full-time management of our work to complete both the environmental impact statement and our revised regulations. John Turner, who you likely know, is a very important member of our leadership team here in BRS. And I'm very pleased to say that John is leading this

1 effort.

2 And a second individual, which is a new face you
3 may not be familiar with, Dr. Michael Wach, a recent BRS
4 hire as an environmental protection specialist within our
5 Environmental and Ecological Analysis Unit. In addition to
6 possessing both a Ph.D. and an environmental J.D. as well,
7 Michael brings research experience in plant pathology and
8 weed science, as well as legal experience working on cases
9 involving NEPA, the Clean Water Act, the Clean Air Act, and
10 other environmental laws.

11 With that short introduction, I would like to turn
12 it over to John Turner, who will be providing the additional
13 background information before you share your information
14 with us.

15 MR. TURNER: As you likely know, we recently
16 participated in inter-agency discussions with FDA, EPA, and
17 the White House, which, while concluding that the
18 coordinated framework --

19 (Interruption.)

20 MR. TURNER: So while I concluded that the
21 coordinated framework provides an appropriate science-based
22 and risk-based regulatory approach for biotechnology, the
23 Plant Protection Act of 2000 provides a unique opportunity
24 for APHIS to revise its regulations, potentially expand our
25 authority, while leveraging the experience gained through

1 our history of regulation to enhance our regulatory
2 framework, and position us well for the future advancements
3 of this technology.

4 We also have concluded those discussions with
5 general agreement on how our biotech regulatory approach
6 would evolve. Still, there is much opportunity for public
7 and stakeholder input, as we move forward and develop the
8 specifics of our regulatory enhancements.

9 Given this, what we would like to do in these
10 meetings is to give an opportunity to hear your thoughts, as
11 well as an informal give and take of ideas.

12 We have a unique opportunity for this type of
13 discussion, since we're not yet in the formal rule-making
14 phase of the process. So we're free to speak with open
15 exchange of ideas with stakeholders and the public.

16 Our discussion will be professionally transcribed
17 primarily for two reasons. First, an accurate record of our
18 discussion will facilitate our ability to capture and refer
19 to your input. And secondly, in the interest of
20 transparency and fairness to all stakeholders, we will be
21 making available as part of the public record, and
22 potentially on our website, documentation of all the
23 stakeholder discussions, so that the public and other
24 stakeholders will have the benefit of each of the
25 discussions that we will be conducting this week.

1 Of course I should emphasize that while we will be
2 happy to share information on the direction we are likely to
3 take during the process, that what we will be sharing is our
4 thinking in BRS. And that during the process, public and
5 stakeholder input will likely influence our thinking.

6 In addition, other officials at USDA, including
7 our Administrator, the Undersecretary, our Office of General
8 Counsel, and the Secretary can certainly be expected to
9 provide insightful direction, as well.

10 So while we value all input, it is important to
11 recognize that our thinking will likely evolve. So that we
12 may have enthusiastic discussions today on a particular
13 aspect of the revisions, it will be an evolving process.

14 Finally, since it will be hard to predict what the
15 final regulations will look like, I would like to share with
16 you some of the overall BRS priority areas of emphasis to
17 set direction and help guide the development of the
18 implementation of the regulatory and policy strategies and
19 operations.

20 First is rigorous regulation, which thoroughly and
21 appropriately evaluates and ensures safety, and is supported
22 by strong compliance and enforcement.

23 Next is transparency of the regulatory process and
24 regulatory decision-making to stakeholders and the public.
25 This is critical to public confidence.

1 We want a science-based system, ensuring that the
2 best science is used to support regulatory decision-making
3 to assure safety.

4 Communication, coordination, collaboration with
5 the full range of stakeholders is also important.

6 And finally, international leadership, ensuring
7 that international biotech standards are science-based,
8 supporting international regulatory capacity-building, and
9 considering international implications of policy and
10 regulatory decisions.

11 As we prepare to begin our discussions now, I want
12 to let you know that for effective transcription of our
13 session, that all statements and questions need to be
14 directed into the microphone. And for those of you who have
15 not previously identified yourselves, please do so for the
16 transcriber, so you can do that one time as you start, and
17 state your name prior to speaking.

18 With that, I will open up the floor to discussion,
19 and I look forward to hearing your comments.

20 MR. BARACH: Thank you very much. I'm Jeff Barach
21 with National Food Processors Association. Welcome to you
22 all. I haven't gotten a chance to meet all of you, but it's
23 quite a good group here.

24 As Cindy mentioned, when she started the concept
25 of these meetings, she was talking about one-on-one, and I

1 guess I took her literally. We initially had quite a few
2 folks who were interested, but they have sort of gone their
3 own way and have set up their own meetings on individual
4 bases with this group. So everybody that I had talked to,
5 at least from our membership, got an opportunity, or will
6 have an opportunity, to meet with this group and discuss the
7 issues.

8 So I'm representing National Food Processors,
9 which is the broadest part of our membership. Our
10 membership includes about 80, 85 percent food processors,
11 and about 15 percent suppliers. And within those supplier
12 groups are some of the folks that you have perhaps talked to
13 already. They supply materials or technology or whatever to
14 the food industry. So companies that are producing the
15 biotech events are actually members of NFPA, also. As you
16 can imagine, some of our discussions get kind of lively at
17 times with food processors and suppliers there in the same
18 room.

19 But it is for a very good discussion at our
20 meetings, and in relation to what the government is doing
21 with regulations, I want to commend this group, and
22 especially Cindy, in pulling this type of a discussion group
23 together, because I think it really represents just the
24 goals that you have. And as you stated earlier, John, about
25 transparency and communication, I think it's a very good

1 step forward to it.

2 This helps me considerably, as I will probably be
3 likely the one who puts the comments together to help
4 formulate some of my thoughts as I start to draft out what
5 we're going to say as a united body of the food chain.
6 These comments often do come from specific members, but they
7 do represent the entire segment of the food industry, which
8 I think is beneficial to us to have one voice, and also
9 beneficial to you to know where we're coming from on some of
10 these issues.

11 As I said and have spoken in several different
12 forums, the food processors are really kind of, are a
13 stakeholder, or sort of a self-proclaimed stakeholder here.
14 Because, as you can imagine, what's going on down on the
15 lower end of the food chain with seeds and developments of
16 research has an impact all the way up.

17 So early on, when PMPs became very visible a
18 couple years ago, one of our goals was to make sure that we
19 had a voice, and that we were looking at the development of,
20 the parallel development of the technology, as well as the
21 regulations, at the same time. So it was important for us
22 to declare ourselves as a stakeholder, and I guess it's
23 worked because we're here. So I appreciate that.

24 We have pretty simple goals in, when thinking
25 about the development of regulations, how they're going to

1 evolve, protecting the food supply of course is one of our
2 primary goals here. But also, we are looking at the
3 development of biotechnology as a benefit, a current and
4 future benefit for the food industry in total. So we want
5 the development of the technology to proceed basically as it
6 will. We want consumer acceptance to progress as it can.
7 And the food industry in the meantime recognizes that there
8 are some risks in the whole system, and we want to mitigate
9 those risks.

10 So we are for biotech. We are for the advantages
11 that it brings to the agricultural industry. We're looking
12 with wide eyes at the future, thinking that there are going
13 to be some consumer benefits to come out of the technology.

14 We are very interested in those. Our membership and
15 consumers in general will be interested in those manifests
16 when they do occur. So that kind of has kept our strong
17 interest and strong support on the table regarding biotech.

18 At the same time, I mentioned the risks associated
19 with certain aspects of it, the pharmaceuticals. We have
20 been very outspoken in the past couple years on that issue,
21 because we see it as important to the integrity of the food
22 supply.

23 So those are our goals. They are pretty
24 straightforward. And as we put our comments together, that
25 will come out pretty strong in where we are.

1 You know, we probably won't get down to some of
2 the levels that many of the individuals that you've talked
3 to and will talk to will. We just won't be at that level of
4 actually the mechanics of what's going on. But we want to
5 have discussion, in sort of a broad sense, of the impacts of
6 biotech plants and plant-made pharmaceuticals.

7 These are very timely discussions that we're
8 having, because as I understand, there is nothing
9 commercially available, as far as a plant-made
10 pharmaceutical, as yet, although there's -- and will
11 continue to go on.

12 So I think from our perspective, this is a good
13 time for input, sort of ahead of the curve. And we hope
14 that we can make a contribution here, if nothing else just
15 to get our voice heard as one more of what we think is
16 important there.

17 Some of the things that have occurred, and Cindy
18 has been very diligent in talking to groups such as the Ag
19 Biotech Forum and other groups, to let us know what your
20 thinking is, what you have been doing, what impacts the
21 industry. And this occurred several times last year. You
22 had some announcements about the 2003 plantings that you
23 gave to us, some announcements about plant-made
24 pharmaceuticals and plant-made industrial chemicals being
25 treated in a similar manner. The permit process,

1 compliance, and enforcement initiatives came out last year.

2 Those all have been to our liking, I can say.

3 For the most part we've been very supportive of
4 those initiatives and the details within them. We were
5 hoping that these initiatives would eventually fold into
6 ANPR or some ruling that takes some of these guidelines and
7 moves them into regulation. I think that's probably what
8 you were planning.

9 But just to reiterate that, what we're talking
10 about today here, as well as those, you know, can fold into
11 some regulations which we think would give some good
12 oversight, in a continually-developing technology that needs
13 some adjustments and corrections as it goes along.

14 Our plan and the comments that we'll make in our
15 formal written comments -- I'll make a lot of comments today
16 probably, and get some feedback from you, which, like
17 yourselves, may be sort of formative thinking that may not
18 end up in the comments that were written, because I have to
19 get approval from all our members as to what exactly we're
20 going to say. So I've been jogging around the country a
21 little bit, and --, as probably you may be doing with us,
22 too.

23 So the plan really here, what we'd like to see --
24 and I mentioned that protecting the food supply is one of
25 our primary goals here, as well as letting the technology go

1 forward -- is really to look at the construction of some of
2 these firewalls that are built through regulation, and to
3 ensure that we feel we're comfortable with it, that these
4 are adequate in achieving our goal.

5 So we'll be looking at that. And sometimes we
6 think that not just one firewall may be important, but there
7 may be redundancy necessary because of the nature of the
8 biological system. And as John mentioned earlier, we, too,
9 because of our background as food processors, have
10 maintained a science-based approach to all we do. We have
11 laboratories. We have Ph.D.s on staff. We're kind of
12 unique that way. So we are different, and can maintain,
13 through the association of our own resources, an
14 understanding of the science. And so perhaps, then, some of
15 the other groups.

16 So when we say science-based, that may be not just
17 rhetoric, but something a little bit more concrete than
18 maybe what others have said.

19 But in thinking about all these regulations that
20 we're talking about, and future regulations, what we'd like
21 to see is an approach to developing regulations that is
22 performance-based. In other words, we're looking for
23 achieving a goal; we're not looking for an prescriptive type
24 of statement. Because we know -- and there's a couple
25 reasons why we want to go with performance-based versus

1 prescriptive.

2 We know that science is changing. And when we
3 look at especially some of the developments that are
4 occurring in containment for plant-made pharmaceuticals, the
5 technology is just getting started. There are going to be,
6 I'm sure, some very unique containment systems that are
7 constructed -- not physical systems, but biological
8 containment systems -- that help us get closer to that 100-
9 percent containment goal that we all would like to see.

10 So that's one of the main reasons that we try and
11 set a goal, set performance standards, and have the
12 regulations meet it, the technology meet it, everybody meets
13 that goal, rather than saying, for instance, you know, you
14 can't grow PMP corn in Iowa or something like that. That,
15 to me, would be very prescriptive. But maybe in a couple
16 years technology would allow you to do that. So that's why
17 we're sticking with trying to formulate regulations and
18 firewalls and whatever we need to ensure the safety of the
19 food supply with some standards that can aim towards that
20 goal.

21 That really kind of rolls up some of the initial
22 comments that I would make. I'd like to kind of get into
23 some questions that I have, some clarification or dialogue.

24 I've talked long enough, I'm getting dry here.

25 So let me open it up with sort of a question for

1 clarification. And perhaps John or Dr. Wach could fill us
2 in a little bit on the environmental impact statement that's
3 going to be developed, a little bit about the mechanics of
4 it. Who is going to be doing it? Maybe it's going to be
5 your group. What the timing is. We know that the National
6 Academy just came out with a report on containment, and
7 maybe that has a lot of the information already in it that
8 we could be using, is that going to be folded into it.

9 And then once we've talked about the mechanics,
10 maybe we could address how it's going to be used. I have an
11 idea what the purpose of it is after it's done, referring to
12 the exercise that's going to be done, but how it's going to
13 help in the effort of --

14 MR. TURNER: In terms of who is going to do it, I
15 refer to myself and Michael Wach mentioned by name. But
16 it's going to be, it's a huge effort. And it will involve a
17 large portion of the resources of BRS. Not all the people
18 all of the time, but we'll be forming different teams to
19 work on different parts of this environmental impact
20 statement.

21 Right now, in terms of time frames, we would like
22 to have a draft finished by sometime next fall. That's a
23 very aggressive time frame, but we're going to attempt to do
24 that.

25 In the EIS, you mentioned a recent National

1 Academy report, there are really three which we've paid a
2 great deal of interest to, the one on bioconfinement just
3 being the more recent. But some of the others speaking
4 directly to the way in which we regulate, and our current
5 regulatory system, and things they think we should consider.

6 So we'll be considering the three reports from the National
7 Academies.

8 Things that we know internally, based on now
9 what's, I guess, over 15 years of experience in regulating
10 these, we have a lot of ideas of improvements. And then
11 stakeholders such as yourself and the others are another
12 major source.

13 So using all that input, we're going to write a
14 draft EIS. It's a good point to point out that this is the
15 early stage for comment, but there will be other times for
16 comments when the draft environmental impact statement comes
17 out. There will be a comment period in there. And at some
18 point that we have a proposed rule, there will be another
19 comment period. So as we get more and more specific, we can
20 get more comment on what we're doing.

21 But the idea is that the EIS, first we will list
22 all of the issues that we're considering, things that we
23 think should be prominent in the new rule. And then you'll
24 explore various actions that you could take, that address
25 those issues.

1 And the idea is if you do a very thorough EIS,
2 then the rule will sort of fall out of the EIS, because it
3 will lead you to certain conclusions. So we'll have the EIS
4 first, and then at some point after that, a proposed rule,
5 and then a final rule.

6 MR. BARACH: So the events that I mentioned that
7 took place last year, which Cindy participated in and got
8 information and made some proposals, as well as this, will
9 roll into a proposed rule when the EIS is done. So that
10 kind of defines the timing, I guess, for these regulations
11 to go through the process.

12 But we're really looking at a draft next fall, and
13 then sometime after that for proposed rules, and then a
14 final rule to follow. So this is going to be a process
15 that's going to take some time.

16 MS. SMITH: That's right. But this is a really
17 significant undertaking that we're doing. We want to make
18 sure we give it the attention it needs in order to really
19 make sure that we're developing the right kind of quality
20 decision-making tools that we need to.

21 Another thing that I would add in terms of the
22 EIS, in addition to tapping probably just about everyone
23 here in BRS for some input into the rule, we also are
24 looking at the possibility of contract amount, certain
25 scientific pieces of it. Particularly, for example, certain

1 scientific questions, maybe to a scientific society or
2 something like that. So we are keeping our options open
3 since there's so much work to be done.

4 MR. BARACH: It sounds like a pretty big
5 undertaking. I would expect there would be parts that
6 perhaps would have to go outside. Okay.

7 To move on to another area that I am interested in
8 getting a little more definition, is the concept of noxious
9 weed, and how that interplays with the current description
10 of GM crops and plant-made pharmaceuticals.

11 I wasn't quite clear whether by incorporating
12 noxious weeds and other biological control agents in the
13 scope, we're talking about the scope now, that what you were
14 doing then, or what you would be doing, would be bringing in
15 plant-made pharmaceuticals as noxious weeds, and classifying
16 it that way? Is that --

17 MS. SMITH: Let me clarify that. What we're not
18 doing is categorizing plants as noxious weeds. What we're
19 doing is we're leveraging the noxious weed authority, which
20 has a very broad definition that essentially, the definition
21 of noxious weed authority is essentially any plant part that
22 could cause harm to food, people, transportation,
23 navigation, all that.

24 And so what we're doing by leveraging that
25 authority is saying we want to look at genetically

1 engineered plants to make sure that they don't pose that
2 type of a risk. And so what the noxious weed authority
3 really does for us, we forgot categorizing these plants as
4 such unless we did an evaluation, and the evaluation came to
5 the conclusion that the particular trait in that crop does
6 pose that kind of a threat.

7 But what it's allowing us to do is just to get to
8 do a very thorough evaluation, looking at much broader areas
9 in our analysis than we currently do under the Plant
10 Protection Act, where we're only looking at plant health.

11 So under the noxious weed authority, it will allow
12 us to look at, for every crop and trait that comes through
13 the door, it will allow us to look at the food safety
14 impact, the impacts to people, impacts to the environment,
15 navigation. To a number of things that are --

16 MR. BARACH: And so do you think some will be
17 classified as noxious weeds?

18 MS. SMITH: It's hard to know. I mean, certainly
19 if they were to meet the definition, then that would be the
20 intent.

21 MR. BARACH: A plant that produced protein that
22 was a toxin, say for instance human toxin, that's not too
23 far-thinking, because some of the protein toxins could be
24 effective in pharmaceutical applications, where, you know,
25 they can kill cancer cells. Yet they would be very

1 hazardous. Something like that perhaps, could we classify
2 it as a noxious weed?

3 MS. SMITH: The idea is for us to have a process
4 to evaluate what's coming to us for regulation against that
5 definition. So that's part of what we are putting together
6 in this process, is what that evaluation will look like.

7 MR. BARACH: But you're thinking perhaps they
8 would be more of a rare event than a common event. In other
9 words, just because it's a plant-made pharmaceutical doesn't
10 mean that it's going to be a noxious weed.

11 MS. SMITH: That's correct. I think based on what
12 we see out there right now, we wouldn't envision a lot. But
13 we'll have to see what comes through the door.

14 MR. BARACH: One of the things that we're
15 interested in, of course, is trade issues. We probably hit
16 on that a couple of times.

17 The production of regular GM crops has evolved
18 from corn, soy, and cotton, as you know. The next crop that
19 may be out there or coming out there would be genetically-
20 modified wheat.

21 Up to this point, the group, your sister group,
22 GIPSA, has incurred, through what's called the letterhead
23 statement, that there is no production of genetically-
24 modified wheat in the United States. There are field trials
25 and things like that, but there is no commercial production,

1 which has been very helpful from a trade issue.

2 One thing that may be helpful in the future is to
3 apply this type of a certification to plant-made
4 pharmaceutical applications. In other words, maybe -- and
5 we would say today that there are no PMPs produced in corn,
6 for instance -- maybe we can get a little feedback on that
7 aspect, as to whether that type of thing would be possible.

8 I'm not hearing that everybody is asking for it,
9 but I think once someone commercializes a plant-made
10 pharmaceutical or industrial chemical in food crop, if that
11 does occur, then our trading partners may want some sort of
12 verification, you know, up to that point, that it's not
13 being produced.

14 Now, after it is produced, and under what
15 conditions, maybe there are different types of letterhead
16 statements that can be made. But it all kind of revolves
17 around the trade issue, and what USDA can do to support the
18 understanding by our trading partners that we haven't had a
19 lot of this.

20 So I just kind of throw that out on the table as
21 something to think about, because -- some of these
22 definitions and such.

23 MS. SMITH: That's an interesting, I think, a more
24 novel idea.

25 MR. BARACH: Oh, you haven't heard that? But, you

1 know, I work with some of our members who sell growth
2 products throughout the countries, and these letterhead
3 statements are very important to them. I had one just the
4 other day, a member asking for a letterhead statement if
5 there was a new genetically-modified asparagus being
6 produced in the United States. And this was very important
7 to him to sell product into Korea.

8 So we are interested in these types of things to
9 help move product along.

10 MS. SMITH: Well, that's interesting. Yes, that's
11 the first time we've heard that. And certainly it will not
12 be our intention, as we update our regulations, to move to
13 regulating on the basis of economics or trade. Of course,
14 it will still be based on risk and science, but that's an
15 interesting suggestion for something that's not really a
16 regulatory consideration, but perhaps something that would
17 be --

18 MR. BARACH: But it's an authoritative statement
19 coming out of a governmental body that says this is the way
20 it is today. Because as you can imagine, dealing with trade
21 issues, there is a lot of information that flows that is not
22 correct.

23 MS. SMITH: Right. Okay, thank you.

24 MR. BARACH: I don't know if the internet helps
25 that, either.

1 MS. SMITH: Right.

2 MR. BARACH: One thing that I had mentioned in an
3 earlier set of comments, Cindy, that I still have some
4 question about. When we talked about -- this came up with
5 the issue of plant-made pharmaceutical, plant-made
6 industrial chemicals -- there was a class of compounds that
7 I was interested to know kind of where they fell. And this
8 was the dietary supplements. Things like Ephedra, whatever.
9 If it's produced in a plant, and it's not the traditional
10 plant. Would that be considered a class A industrial
11 chemical? Or would it be a pharmaceutical? Or is it
12 something that, you know, would fall in the cracks, that
13 maybe we need to be sure that it's covered somewhere?

14 I haven't got any first-hand experience if
15 anybody's doing that, but I can envision that, because of
16 the popularity of dietary supplements, to have some way to
17 work things, or when we define, you know, what is covered,
18 what is a plant-made industrial chemical. So that will
19 probably be something that is in some of our comments.

20 MR. HOFFMAN: Would something like vitamin-E
21 enhanced plants that are already out there, would that fall
22 into this category? Or are you talking about something that
23 might have a little bit of a stronger biological activity?

24 MR. BARACH: Something with a stronger biological
25 activity. I think that we, the industry already has

1 developed some corn plants with different oil, or soy plants
2 with different oil compositions, or enhanced oil
3 compositions. Those kinds of things I think we're
4 comfortable with. The dietary supplements that are
5 biologically active.

6 MR. HOFFMAN: So maybe in the category that
7 somebody has referred to as botanicals.

8 MR. BARACH: Right.

9 MS. KOEHLER: Ephedra or something like that.

10 MR. BARACH: Yes, where does it fall. We just
11 want to cover it somewhere. So it hopefully would get a
12 permit to leave it in the system.

13 Let's talk a little bit about the tiers approach,
14 multi-tier approach. Does this mean that the notification
15 process goes away entirely?

16 MS. SMITH: That's correct.

17 MR. BARACH: And everything starts out sort of in
18 a tiered process based on risk?

19 MS. SMITH: Yes, that's right. What we are
20 talking about is replacing, essentially, notification and
21 permitting, with simply permitting. So depending upon the
22 level of risk, it would receive a different permit.

23 MR. BARACH: This is probably a little out of
24 order, because I think I'm going to come back to the
25 deregulation a little bit later. But I had a note here to

1 myself to ask about plant-made pharmaceuticals, plant-made
2 industrial chemicals. Would there be a condition where they
3 would become deregulated?

4 I could, at least I thought that plant-made
5 pharmaceuticals, they would never be regulated, and maybe
6 plant-made industrial chemicals would be at some time. Is
7 that kind of where you're --

8 MS. SMITH: What you would see, I think, under the
9 new regulations is that we would propose that if
10 pharmaceutical and industrial crops can meet the same safety
11 criteria as needed to in order to be deregulated, then they
12 could be deregulated. It would be a question of whether
13 they can meet that safety criteria or not.government

14 MR. BARACH: Did you say both? I'm sorry, both?

15 MS. SMITH: Yes. If they could meet the safety
16 criteria. And then I think you see in the questions, I
17 think in our number six we are referring to our thinking
18 must expand on that a little bit.

19 MR. BARACH: That's good, because that was my next
20 one.

21 MS. SMITH: What we're thinking there is that
22 probably many of the pharmaceutical and industrials will not
23 be deregulated, but instead will be maintained under
24 regulation.

25 And so we're looking at if there is a unique

1 mechanism that we need to establish to facilitate that
2 specific type of regulation, where it's essentially a field
3 test that's going to be conducted on a long-term basis, the
4 same research or field tests will be run year after year
5 when something is going to commercialization. Is there some
6 better mechanism for us to regulate essentially the
7 commercialization of pharmaceutical and industrial products
8 while they are still under our oversight?

9 MR. BARACH: Okay. That wouldn't be any different
10 than PMPs, for instance. Because when they are
11 commercialized, you're still going to have strong oversight
12 over it. They will always be under permit.

13 MS. SMITH: Well, I think what you're going to be
14 seeing in the new regulation is the option, if PMPs and PMIs
15 can meet the safety criteria associated with the
16 deregulation, they could come out from under regulation if
17 they can meet that safety criteria. In other words, if they
18 pose no environmental or food safety or other types of
19 risks.

20 Alternatively, we're looking at having a different
21 mechanism under the assumption that many PMPs and PMIs will
22 actually go to commercialization still under government
23 regulation. We're looking for a different mechanism in
24 order to enable us to do that.

25 For example, instead of a company coming to us

1 every year requesting a permit to do a field test, we do a
2 full review of that. We issue a permit, and then they come
3 back next year with the exact same request. They gathered
4 all the information again, they submit the package again.
5 We do another review. And we have to do that every year,
6 let's say, if they're going to be in commercial production
7 for five years.

8 What we're looking at is, is there some kind of a
9 mechanism we can use to make that more efficient? Where
10 they develop a long-term plan, and they share the long-term
11 plan with us? And perhaps every year they're providing us
12 additional information, information either that becomes new
13 and is available because of the science, or that they
14 learned as a result of the previous year's crop, an analysis
15 of that crop and data gathered through that.

16 Another thing we're looking at is how we can make
17 commercialization of pharmaceuticals and industrials, while
18 under government regulation, more transparent. Because we
19 think it's really important for the public to have a sense
20 of confidence in what it is that's being field tested, and
21 the safeguards that are in place for that field testing. So
22 we're also looking for how we can provide more information
23 to the public. Honor confidential business information, but
24 have a mechanism that is more open to the public in terms of
25 communicating what's being field tested, and why it's safe

1 to be field tested in the way that we approved it to be
2 tested.

3 MS. BECH: A point of clarification. It would
4 have to meet more than just USDA safety. We're talking
5 about considering FDA's approvals and things like that, as
6 well.

7 MR. BARACH: I want to talk a little bit about
8 that. But okay, that is helpful, because I wasn't clear
9 when you described in number six, what a new mechanism is,
10 exactly what you were referring to there.

11 MS. SMITH: And that's something that there is a
12 lot of room to develop what that looks like. We don't have
13 something very clearly in mind. We have some ideas, but
14 that's the kind of thing that we're looking for comments on.

15 MR. BARACH: I don't know how much help we would
16 be there, because you know, not having experience with the
17 permitting process or knowing what the steps are.

18 MS. SMITH: Well, the way that you can be helpful
19 is just in making sure that we are aware of what your
20 concerns are. And then we could make sure we're addressing
21 those concerns in the process that we develop.

22 MR. TURNER: The idea is not necessarily to give
23 lighter regulation, but to have a more efficient process.
24 It's going to a different stage, to focus on what's
25 important in terms of routine production.

1 MR. BARACH: In the write-up that you talk about,
2 adventitious presence, and I know that we had some
3 discussions at different forums about that, that is a very
4 important concept to us, because it is a little bit of a
5 relief valve. We know that biological systems aren't going
6 to be 100-percent pure in all cases.

7 But I wanted to point out that I think it has at
8 least three components that are important. One is the one
9 that you are looking at, for adventitious presence in the
10 field trials, that there's something that happens there, or
11 even in commercialization. But that's probably the point
12 that you have the most focus on.

13 But in addition to that, there is the concept for
14 adventitious presence in regard to what the FDA regulations
15 are. Here we're talking about a situation where
16 adventitious presence may be allowed or may be permitted in
17 a field trial, but yet when it enters into the system, it
18 takes on a different light from an FDA standpoint. In other
19 words, the food or the food material becomes adulterated.

20 So that's another aspect of AP that we want to
21 work on.

22 And the third is the international aspect, the
23 trade aspects. I know you're not going to deal directly
24 with that, but that's okay. But just to keep it on the, you
25 know, on the horizon as far as thinking about if we solved

1 an AP problem, if we make a regulation or if we have a way
2 to fix it, we need to think about all three of those
3 components, so that the fix meets the need, which is our
4 need on at least those three, and maybe other ones.

5 I just wanted to bring that up. I think going
6 down the road towards that AP tolerances, the way we handle
7 it, the way we describe it is right-on. I'm not
8 discouraging that. I'm just saying, you know, that let's
9 think about these other things that are on the, you know,
10 that some of the other groups have to worry about when we
11 make a fix.

12 MS. SMITH: We appreciate you pointing it out.
13 And that's actually a pretty good paradigm for most of what
14 we're considering, is any changes that we consider, making
15 sure they're complementary to what's happening with the
16 other agencies, as well as the impacts, the international
17 considerations.

18 MR. BARACH: This particular one, though, it
19 really juts out.

20 MS. SMITH: It really does.

21 MR. BARACH: Because it has special needs all the
22 way through.

23 Another area that I think is important is what we
24 perceive as being one of the most difficult aspects -- and
25 I'm getting back to plant-made pharmaceuticals -- of how

1 these things are going to be --

2 We know the regulations are going to be there. We
3 know that the intent of the companies are going to be the
4 best. But it's the human error that we worry about the
5 most. And there doesn't seem to be a real good fix on that.

6 But we have some suggestions. And one thing we'd
7 like to see, and we like it so far as what we've seen, is
8 the concept of HACCP. And I think we've been introduced to
9 it probably not really in a lot of depth yet, because it is
10 something that is really something new.

11 For those of you who may not know what it is, I'll
12 back up a little bit. The food system, production of food
13 has had what's called HACCP, hazard analysis critical
14 control point, programs for many years, dating all the way
15 back to the 1960s. These have more currently been regulated
16 by both the FDA and USDA for meat, poultry, on the USDA
17 standpoint, for seafood and for juice from the FDA
18 standpoint.

19 So we are familiar with HACCP, analyzing the
20 hazards, developing the firewalls or the solutions, so that
21 the hazard doesn't occur in food, and that the food that's
22 produced is safe. There's lots of material on that. And if
23 you look on even the FDA's website, and perhaps the USDA's,
24 you'll find out more about what HACCP is.

25 HACCP is the parallel approach for containment.

1 And we've worked with several of the other credit groups and
2 individual companies to take the principles of HACCP, and to
3 move them into the containment area, so that the containment
4 hazards are identified, and that they're mitigated in their
5 approaches.

6 We see that this is valuable, and puts a
7 systematic approach to addressing these issues, some of the
8 issues that we've had. And it also fits into our
9 description of letting people choose whatever containment
10 systems they have, and not prescribing something, but
11 letting the performance be whatever it's set at. So that
12 you can meet that using a systematic approach and a
13 scientific approach.

14 We'd certainly like to see that the industry, and
15 for all levels of the industry, be they the big companies,
16 the smaller biotech companies, or even the universities,
17 which we worry about, too, could develop some sort of
18 approach using this systematic analysis. We'd like to see
19 that tied in maybe to the permitting process, and then
20 institutionalized, and then maybe even regulated. Always
21 lay it on the table. I think that's the way it worked well
22 for the food industry. I can see that that may work very
23 well for this group. It wouldn't happen overnight, but
24 certainly it's an approach to developing some systems that
25 have real value and gain a lot of the goals that we're all

1 interested in.

2 Certainly I would volunteer to work with anybody,
3 you know, to describe more about what goes on in the food
4 system. And some of the other folks can talk a little bit
5 about what they developed as far as the plant-made
6 pharmaceutical containment.

7 Another thing that we are concerned about, as I
8 mentioned at the outset, we're one of the stakeholders. We
9 have a lot of perceived risk in some of these things, and
10 not a lot of reward. So one thing that pops out to us and
11 the question that often comes up is, well, who assumes the
12 liability of these issues as somebody develops and puts a
13 new pharmaceutical or a new GM crop out on the market?
14 Where does the liability fall?

15 Unfortunately, we've had in our experiences with
16 Starlink -- I know it's not exactly the same, but the food
17 industry has had to go through some generations in giving
18 product back and handling products. So liability is an
19 issue.

20 In trying to think about what USDA has in
21 resources already, so we don't have to invent something
22 totally new, I don't know enough about these groups of know
23 whether there's any interplay or discussion or whatever.
24 But two groups kind of pop out when you think about
25 liability. The Commodity Credit Corporation helped the

1 Starlink situation. And you've got another group, Federal
2 Crop Insurance Corporation, that deals with the farmers and
3 their issues of crop production.

4 I don't know whether there's any discussion that's
5 even reasonable between, you know, your group and these
6 groups to talk about the issues of liability. But just to
7 put it on the table is something we're concerned about. How
8 do we make sure that the companies that are going down these
9 roads to development have the resources to back up any
10 mishap that occurs? Do you make them take out a bond or
11 something? Or do you make them get a huge amount of
12 liability insurance, or whatever, I don't know.

13 Some of the companies are pretty small, and they
14 are running fast and furious on venture capital. They don't
15 have a lot of resources. Bigger companies, I think, I don't
16 worry too much about them having the resources to handle it.

17 But that's just an issue, and we don't really address this
18 issue. Maybe this is not the best forum. But I know the
19 USDA has dealt with this, and has these other groups. So
20 perhaps a discussion to find out what's going on would be
21 valuable. And to talk about our liability with some of
22 these other groups, if that would be appropriate, we would
23 be glad to talk about that.

24 Perhaps the last topic that I wanted to cover was
25 one that involves more of an interaction between the

1 agencies that we've been working on, and -- about ready.

2 The FDA came out with a premarket biotech
3 replication proposed rule back in, I think it was January of
4 2001. And what the proposal there was was twofold. One was
5 to get information out to the public, to be more transparent
6 about what was going to be commercialized. But the other
7 one was to give confidence that there is somebody actually
8 looking at these developments before they come out on the
9 market.

10 We first talked to FDA, and that process seems to
11 be stalled, for various reasons. We're interested in fixing
12 that, if possible, because we still think there's a
13 transparency need, and we still think that the
14 commercialization of crops -- we're talking about regular
15 genetically-modified crops -- ought to be put out there
16 ahead of time, before the crops are actually commercialized.

17 There is, in your deregulation process, there is
18 an element which addresses something similar. And this is
19 the element number seven, adverse consequences of an
20 introduction of a new cultivar.

21 One of the criteria is that there is no known
22 reported toxic properties. So for someone to get a
23 deregulated product, they must meet the certain criteria
24 that you have.

25 Now, I don't know, I'm not that familiar with how

1 that traditionally has been approached. But I'm thinking
2 that that may have some relevance to what we're thinking
3 about, where there is no known reported toxic properties.
4 If you were to confirm that with the FDA, there would be a
5 good interplay between agencies. And before the
6 deregulation process started.

7 Now, I know it's not always the most popular topic
8 to have agencies necessarily layered or relying on each
9 other too much, because the process gets slowed down. But
10 in this case it may be appropriate, before deregulation
11 occurs, to work with another agency that is addressing, as
12 it seems, that there's no known reported toxic properties as
13 one of your criteria, to get a confirmation. So that this
14 information, before the product is commercialized --

15 I just lay that on the table. I think that that's
16 probably an area we ought to work more with you on, one on
17 one. But that's one way to do it. There's probably a lot
18 of other ways, but just thinking about that.

19 We think that that's an admirable goal, to get to
20 a point where we can notify the public. And it fits well in
21 our goals for transparency, and also it sounds like with
22 your goals, too.

23 That pretty much exhausts my list. And as I said,
24 our comments, our written comments will reflect --, in
25 addition to our membership. So they may come out slightly

1 different than this. We don't always reach consensus on all
2 things, but they don't tend to be too far off. And that
3 will be the written record of what statements we make.

4 MS. SMITH: Okay, well, thank you. Can we take a
5 couple minutes to see if we have any questions we want to
6 ask?

7 MR. BARACH: Sure.

8 MR. WACH: Actually, I have a question.

9 MS. SMITH: Yes? Go ahead.

10 MR. WACH: This is Mike Wach speaking. One of the
11 things we're really hoping for in this process is for the
12 EIS not only to address where we are now, but we want it to
13 be a forward-thinking document. We want the rules to be
14 forward-thinking, sa well.

15 And one of the trends that we see, in terms of
16 genetic modifications that are proposed, are those that
17 would either enhance nutritional quality or enhance food
18 processing parameters.

19 And I wanted to ask you, as a representative of
20 your organization, how do you feel about those? Do you feel
21 that those need the same kind of care that a PMP would? The
22 same kind of oversight that you would look for in terms of
23 adventitious presence? And also, how do you feel that the
24 perception is moving on those sorts of trades, as opposed to
25 pharmaceuticals and industrials?

1 MR. BARACH: That's a good question. And it fits
2 well within some of our discussions that we've had
3 internally about what the benefits of biotech are for the
4 food industry.

5 And we have talked to our membership about those
6 types of developments in nutrition. Do they want events or
7 developments that allow processing to occur under less
8 energy or less waste, or whatever? You know, all those are
9 interesting concepts.

10 Probably the limit comes out that rises to the
11 top, is the concept of something health-related as being the
12 most interesting to consumers, and also to our food company
13 members. So some concept that makes food healthier,
14 whatever that is, is something that probably will be some of
15 the first things to come out, and hopefully some of the
16 things that are most attractive to food processors.

17 As far as the way that they would be regulated, I
18 think you almost have to look at them on a case-by-case
19 basis. Look at vitamin A. Vitamin A, at very, very high
20 levels, can be toxic. So I'd have a problem there if that
21 were to occur. But yet, you know, if it's just enhanced two
22 or three times or something to the level that's in a vitamin
23 tablet, you know, maybe not.

24 So it's almost a case-by-case basis, I think. And
25 that's how, to the extent you are looking at a lot of these,

1 and your new structure seems to allow that to occur by
2 looking at the risk, by associating each of those.

3 MS. KOEHLER: If I might follow up on that. I
4 know there are at least two research groups that are looking
5 at reduced allergens, one in rice and the other one in
6 soybeans. I mean, that would be something with obvious
7 health benefits, but for which you would need just as much
8 segregation to keep that product pure if you're going to
9 reap the benefits of it, as you would for a pharmaceutical.
10 Has there been any discussion at all in the food
11 industry for those kinds of products?

12 MR. BARACH: Definitely. Also for wheat, with
13 celiac disease. You know, that is another area that, as
14 well as the ones you mentioned, where there could be a
15 product which is a high-value product, and it's going to be
16 more expensive because you're going to have to use identity
17 preservation-type systems. You're going to add a certain
18 amount of cost to it to segregate it to contain it, to
19 certify that it is what it is, to test it.

20 But yet there may be a market for those types of
21 products, just like there would be for organic or others.
22 So I think that yes, those health-related-type products,
23 reduced-allergy products, would be valuable. And could be
24 segregated, could fit within the system. And should not be
25 difficult to regulate under the current system.

1 MS. SMITH: Questions? Okay, then, thank you. We
2 really appreciate you coming in. We appreciate your
3 comments, and look forward to talking to you in the coming
4 months, as well.

5 MR. BARACH: Thank you very much. I appreciate
6 all of your efforts.

7 MS. SMITH: Thank you.

8 (Whereupon, at 2:38 p.m., the meeting in the
9 above-entitled matter was adjourned.)
